FOR IMMEDIATE RELEASE

Bioremediation Cleaning Eliminates Hazardous Waste

Bioremediation uses naturally safe hydro-carbon converting microbes in the cleaning solution to eliminate oil, grease and most other organic impurities, virtually eliminating waste disposal. Graymills' series of bioremediating parts cleaners will do just that... eliminate waste disposal... along with waste disposal costs and service contracts.

Designed specifically for the bioremediation process the BIO436R & BIO536R are constructed of high-density polypropylene with modern, electronic controls to stand up to the rigors of today's parts cleaning needs, and deliver years of dependable service. A powerful 300 GPH pump delivers heated, aqueous, non-hazardous, pH neutral cleaning solution through the Flo-Thru brush or stay-put adjustable flush nozzle. Built-in safety features include low liquid level and ground fault circuit protection and fusible safety link on lid.
